

Claims: Claims 1-12 are amended in this office action response. Additions to claims are indicated by underlining. Deletions from claims are indicated by strikeouts. No claims are canceled in this office action response. Upon entry of this amendment, claims 1-12 will be pending in this application.

Listing of Claims:

1. (currently amended) A method ~~for using a scanning device~~, comprising:
decelerating an object from moving at a first substantially constant speed
in a first direction through a scanning device;
measuring first reflected light from a first section of the object that moves
past an optical sensor during the decelerating the object;
~~causing relative movement between the object and an optical sensor;~~
moving the optical sensor in the first direction for a first distance
substantially equal to a sum of an acceleration distance of the object and a deceleration
distance of the object; and
moving the first section of the object past the optical sensor at the first
substantially constant speed in the first direction while and measuring second reflected
light from the first section of the object.
2. (currently amended) The method as recited in claim 1, further comprising:
generating a first set of data from the measuring the first reflected light;
and
generating a second set of data from the measuring the second reflected
light.

Response A

3. (currently amended) The method as recited in claim 2, wherein:

~~causing relative movement includes moving the optical sensor in a first direction the object moves through the scanning device during scanning for a first distance substantially equal to a sum of an acceleration distance of the object and a deceleration distance of the object;~~

~~causing relative movement includes moving the first section of the object past the optical sensor at the first substantially constant speed in the first direction; and~~

the object includes media.

4. (currently amended) The method as recited in claim 2 3, further comprising:

replacing the first set of data with the second set of data.

5. (currently amended) ~~The A method, comprising: as recited in claim 2,~~
wherein:

decelerating an object from moving at a first substantially constant speed in a first direction through a scanning device;

measuring first reflected light from a first section of the object that moves past an optical sensor during the decelerating the object;

~~causing relative movement includes moving the object in a first second direction, opposite a second the first direction the object moves through the scanning device during scanning, for a first distance substantially equal to a sum of an acceleration distance of the object and a deceleration distance of the object; and~~

~~causing relative movement includes moving the first section of the object past the optical sensor at the first substantially constant speed in the second first direction while measuring second reflected light from the first section of the object; and~~

~~the object includes media.~~

6. (currently amended) The method as recited in claim 5, further comprising:

generating a first set of data from the measuring the first reflected light;

generating a second set of data from the measuring the second reflected light; and

replacing the first set of data with the second set of data.

7. (currently amended) The A method, comprising: as recited in claim 2, wherein:

decelerating an object from moving at a first substantially constant speed in a first direction through a scanning device;

measuring first reflected light from a first section of the object that moves past an optical sensor during the decelerating the object;

~~causing relative movement includes moving the optical sensor in a first second direction, opposite a ~~second~~ the first direction the object moves through the scanning device during scanning, for a first distance substantially equal to a sum of an acceleration distance of the optical sensor and an acceleration distance of the object; and~~

~~causing relative movement includes moving the optical sensor in the ~~second~~ first direction at a second substantially constant speed for a second distance substantially equal to a sum of the acceleration distance of the object and the deceleration distance of the object; while measuring second reflected light from the first section of the object.~~

~~causing relative movement includes moving the optical sensor in the first direction for a third distance substantially equal to a sum of a deceleration distance of the optical sensor and a deceleration distance of the object; and~~

~~the object includes media.~~

8. (currently amended) The method as recited in claim 7, further comprising:

moving the optical sensor in the second direction for a third distance substantially equal to a sum of a deceleration distance of the optical sensor and a deceleration distance of the object; and

measuring third reflected light from a second section of the object corresponding to the acceleration distance of the object that the optical sensor moved past when moving the first distance and the second distance.

9. (currently amended) The method as recited in claim 7 8, further comprising:

generating a first set of data from the measuring the first reflected light;

generating a second set of data from the measuring the second reflected light; and

replacing the first set of data with the second set of data.

10. (currently amended) ~~The A method, comprising as recited in claim 2,~~ wherein:

decelerating an object from moving at a first substantially constant speed in a first direction through a scanning device;

measuring first reflected light from a first section of the object that moves past an optical sensor during the decelerating the object;

~~causing relative movement includes~~ moving the optical sensor in a the first direction the object moves through the scanning device during scanning for a first distance substantially equal to a sum of an acceleration distance of the optical sensor and a deceleration distance of the object; and

~~causing relative movement includes~~ moving the optical sensor in a second direction, opposite the first direction, at a second substantially constant speed for a second distance substantially equal to a sum of the deceleration

distance of the object and an acceleration distance of the object while measuring second reflected light from the first section of the object;

~~causing relative movement includes moving the optical sensor in the first direction for a third distance substantially equal to a sum of a deceleration distance of the optical sensor and the acceleration distance of the object; and~~

~~the object includes media.~~

11. (currently amended) The method as recited in claim 10, further comprising:

moving the optical sensor in the first direction for a third distance substantially equal to a sum of a deceleration distance of the optical sensor and the acceleration distance of the object; and

measuring third reflected light from a second section of the object corresponding to the acceleration distance of the object that the optical sensor moved past when moving the first distance and the second distance.

12. (currently amended) The method as recited in claim 10 ~~11~~, further comprising:

generating a first set of data from measuring the first reflected light;
generating a second set of data from measuring the second
reflected light; and

replacing the first set of data with the second set of data.
